# What we want to introduce

- Problem decomposition
  - Decide which problem to solve
  - Not always required to solve complete problem in one go
- Modelling with bin packing
- Customized search routines can bring dramatic improvements
- Understanding what is happening important to find improvements

# Problem Definition

## Progressive Party

The problem is to timetable a party at a yacht club. Certain boats are to be designated hosts, and the crews of the remaining boats in turn visit the host boats for several successive half-hour periods. The crew of a host boat remains on board to act as hosts while the crew of a guest boat together visits several hosts. Every boat can only host a limited number of guests at a time (its capacity) and crew sizes are different. The party lasts for 6 time periods. A guest boat cannot not revisit a host and guest crews cannot meet more than once. The problem facing the rally organizer is that of minimizing the number of host boats.

# High Level Problem Decomposition

- Phase 1: Select minimal set of host boats
  - Manually
- Phase 2: Create plan to assign guest boats to hosts in multiple periods
  - Done as a constraint program

# Idea

- Decompose problem into multiple, simpler sub problems
- Solve each sub problem in turn
- Provides solution of complete problem
- Challenge: How to decompose so that good solutions are obtained?
- How to show optimality of solution?

# Selecting Host boats

- Some additional side constraints
  - Some boats must be hosts
  - Some boats may not be hosts
- Reason on total or spare capacity
- No solution with 12 boats (with side constraints)

# Solution to Phase 1

- Select boats 1 to 12 and 14 as hosts
- Many possible problem variants by selecting other host boats

# Phase 2 Sub-problem

- Host boats and their capacity given
- Ignore host teams, only consider free capacity
- Assign guest teams to host boats

# Model

- Assign guest boats to hosts for each time period
- Matrix (size  $NrGuests \times NrPeriods$ ) of domain variables  $x_{ij}$
- Variables range over possible hosts  $1..NrHosts$

# Constraints

- Each guest boat visits a host boat at most once
- Two guest boats meet at most once
- All guest boats assigned to a host in a time period fit within spare capacity of host boat

# Each guest visits a hosts atmost once

- The variables for a guest and different time periods must be pairwise different
- `alldifferent` constraint on rows of matrix
- `alldifferent({xij | 1 ≤ j ≤ NrPeriods})`

# Two guests meet at most once

- The variables for two guests can have the same value for at most one time period
- Constraints on each pair of rows in matrix
- $x_{i_1 j} = x_{i_2 j}, i_1 \neq i_2 \Rightarrow x_{i_1 k} \neq x_{i_2 k} \quad 1 \leq k \leq \text{NrPeriods}, k \neq j$

# All guests assigned to a host in a time period fit within spare capacity of host boat

- Capacity constraint expressed as bin packing for each time period
- Each host boat is a bin with capacity from 0 to its unused capacity
- Each guest is an item to be assigned to a bin
- Size of item given by crew size of guest boat

# Bin Packing Constraint

- Global constraint  
`bin_packing(Assignment, Sizes, Capacity)`
- Items of different sizes are assigned to bins
- Assignment of item modelled with domain variable (first argument)
- Size of items fixed: integer values (second argument)
- Each bin may have a different capacity
- Capacity of each bin given as a domain variable (third argument)

# Naive Search (Compact view)

# Naive Search (Zoomed)

# Observations

- Not too many wrong choices
- But very deep backtracking required to discover failure
- Most effort wasted in “dead” parts of search tree

# First Fail strategy

```
assign(List):-  
    search(List, 0, first_fail, indomain,

# First Fail Search (Zoomed)

# Observations

- Assignment not done in row or column mode
- Tree consists of straight parts without backtracking
- ... and nearly fully explored parts

# Idea

- Assign variables by time period
- Within one time period, use `first_fail` selection
- Solves bin packing packing for each period completely
- Clearer impact of disequality constraints
- Serial composition of search procedures

# Layered Search

```

  (for(J,1,NrPeriods),  
   param(Matrix,NrGuests) do

# Layered Solution (Zoomed)

# Observations

- Deep backtracking for last time period
- No backtracking to earlier time periods required
- Small amount of backtracking at other time periods

# Idea

- Use credit based search
- But not for complete search tree
- Loose too much useful work
- Backtrack independently for each time period
- Hope to correct wrong choices without deep backtracking

## Reminder: Credit Based Search

- Explore top of tree completely, based on credit
- Start with fixed amount of credit
- Each node consumes one credit unit
- Split remaining credit amongst children
- When credit runs out, start bounded backtrack search
- Each branch can use only  $K$  backtracks
- If this limit is exceeded, jump to unexplored top of tree

# Layered with Credit

```
assign(Matrix, NrPeriods, NrGuests) :-  
    (for(J, 1, NrPeriods),  
     param(Matrix, NrGuests) do  
         NSq is NrGuests*NrGuests,  
         search(Matrix[1..NrGuests, J], 0,  
                first_fail, indomain,  
                credit(NSq, 10), [])  
     ).

# Layered with Credit Search (Zoomed)

# Observations

- Improved search
- Need more sample problems to really understand impact

# Idea

- Randomize value selection
- Remove bias picking bins in same order
- Allows to add restart
- When spending too much time without finding solution
- Restart search from beginning
- Randomization will explore other initial assignments
- Do not get caught in “dead” part of search tree

# Randomized with Restart

```
assign(Matrix,NrPeriods,NrGuests):-  
    repeat,  
    (for(J,1,NrPeriods),  
     param(Matrix,NrGuests) do  
         NSq is NrGuests*NrGuests,  
         once(search(Matrix[1..NrGuests,J],0,  
                    first_fail,indomain_random,  
                    credit(NSq,10),[]))  
    ),

# Observations

- Avoids deep backtracking in last time periods
- Perhaps by mixing values more evenly
- Impose fewer disequality constraints for last periods
- Easier to find solution
- Should allow to find solutions with more time periods

# Changing time periods

Problem	Size	Naive	FF	Layered	Credit	Random
10	5	0.812	1.453	1.515	0.828	1.922
10	6	14.813	2.047	2.093	1.219	2.469
10	7	79.109	3.688	50.250	3.234	3.672
10	8	-	-	141.609	55.156	6.328
10	9	-	-	-	-	10.281

# Observations

- Randomized method is strongest for this problem
- Not always fastest for smaller problem sizes
- Restart required for size 9 problems
- Same model, very different results due to search
- Very similar results for other problem instances

# Outline

- 1 Problem
- 2 Program
- 3 Search
- 4 A Further Decomposition

# Further Improvement

- Idea: There is no real effect of including later time periods in constraint model
- Only current time period matters
- Decomposition: Set up model for one period at a time

# Fine Grained Decomposition

Old	New
Bin packing	Bin packing
All different	Domain restrictions
Meet at most once	Disequalities between guest boats

# Generated Graph Coloring Problem

- Guest boats = Nodes
- Host boats = Colors
- Disequality constraints = Edges in graph

# Visualization (Time period 2)

# Visualization (Time period 3)

# Visualization (Time period 4)

# Visualization (Time period 5)

# Visualization (Time period 6)

# Solving the Graph Coloring Problem

- Use disequality constraints
  - Weak propagation
- Extract `alldifferent` constraints
  - Edge clique cover problem
  - Choice of consistency method
- Use `somedifferent` global constraint
  - Heavy
  - Interaction with `bin packing` constraint
